

BUG THEM BEFORE THEY BUG YOU!

Here's how to get ahead of the bugs that bite.

Just find the nesting sites!

Larval (non-adult) mosquitoes collect and grow in standing water in the unlikeliest of places: an old tarp, a bucket, a deflated paddling pool, a flower pot, even a wet plastic bag.

So if you see a container in your yard with standing water, just tip it over — the water will drain away and so will all those pesky pests-in-training.

It's an easy way to help protect you, your family, and neighbors this coming summer.
